

Meet Interoperability & Patient Access Requirements for Providers

Put your clients in charge of their own health data and ensure 100% interoperability. The eINSIGHT Clinical Data Repository (CDR) makes it easy for providers and counties to access up-to-date clinical information and provide better proactive health support to clients.

With eINSIGHT you can meet and exceed CMS & ONC client/patient data requirements with out-of-the-box enterprise-level authorization, audit, compliance monitoring, and security integration tools. Break down existing data silos and allow for scalability and flexibility for your evolving organizational requirements.

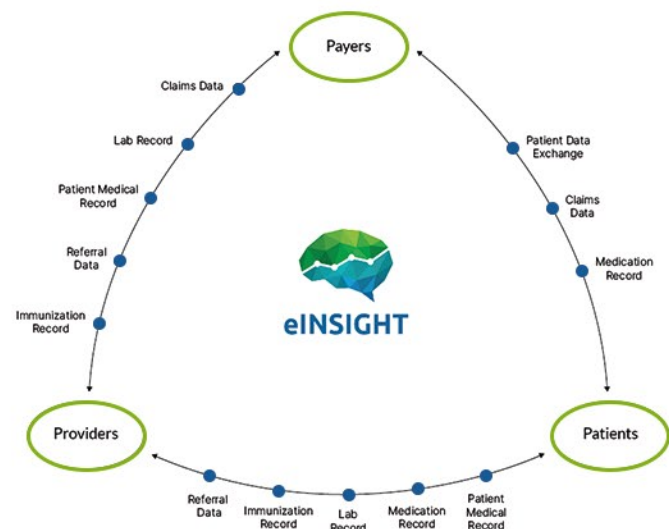

CMS & ONC Requirements for Patient/Member Data

Health and Human Services (HHS) rules will require providers to give clients access to their health information through any web-enabled device. By April, 2022 clients must be empowered to access and manage their personal health-care information. To comply with regulatory requirements, providers must implement a system using Fast Healthcare Interoperability Resources (FHIR) to provide:

- Patient Access API
- Provider Directory API
- Payer to Payer Data Exchange

To gain compliance, providers must act quickly to meet CMS & ONC timelines. The eINSIGHT CDR/HIE provides you with an innovative, cost-effective, turn-key solution to meet these timelines and requirements without requiring any changes to your existing EHR, IT systems, or data models.

In addition to meeting these requirements, the eINSIGHT platform provides limitless flexibility and scalability to meet evolving organizational requirements. Able to handle the needs of small clinics, decentralized providers and national health plans alike, our turnkey platform can be deployed and customized in a matter of weeks, not months while aligning with your current IT infrastructure.

Build a Clinical Data Repository

The future of healthcare technology is data compatibility for regional exchanges. Streamline your complex network of provider information by integrating disparate EHR's and other legacy systems. Overcome the challenges of integrating different vendor solutions into one flexible, configurable, secure exchange. Utilize a customizable Clinical Data Repository built on the visionary HL7-FHIR global standards to ensure long-term scalable solutions.

Lead and Leverage Data Access

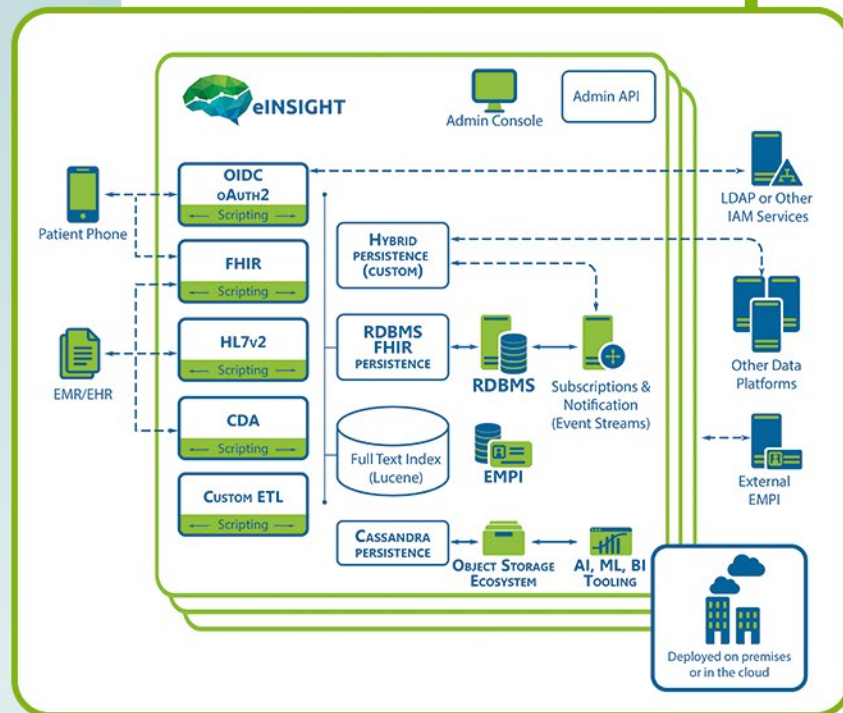

Until now, healthcare data systems and vendors have made it difficult for organizations to share client point of care information across EHR platforms. With the eINSIGHT platform, you'll have a Master Data Repository and be ready for the future of real-time analysis using Artificial Intelligence (AI) and Machine Learning (ML) to analyze data for potential fraud, identify inefficiencies in client services, predict high utilizer patient needs, and ultimately, improve client outcomes.

Monitor Population Outcomes

Electronic health records are only one source of important data. The shift toward value-based care will require a consolidated data set consisting of clinical information from EHRs, diagnostic data from labs, pharmaceutical information, behavioral health outcomes data, social determinants of health, and financial information from billing. The eINSIGHT platform allows you to break down data silos and sharpen your focus on reducing costs through positive population health outcomes.

Utilize our Independent Expertise

Let our team of experts guide you through the many challenges of effective CDR/HIE implementation while employing the latest technologies. We have years of experience with large and small organizations, state, provincial, and federal projects across North America. Technical strategic planning is critical for creating the roadmap to meet your strategic objectives but it must be coupled with effective implementation management to ensure tactical, cost effective, and timely execution.
